

Welcome to our Junior-Test!

Task:

- Extract the data from this endpoint: <https://api.bitpanda.com/v1/masterdata>
- Build a project using **Angular and Typescript**. Import the data from the endpoint above, take the sub-responses **Cryptocoins, Commodities, Fiats and Indexes****.
Please visualize the data from those sub-responses!
 - Set up any **object/class structure** you think is feasible
 - You dont have to visualize ALL the information from the sub-responses! Look at the data, think about what might make sense.
 - Once you decide you are done, please zip up your project and send it to us or share it via your git repo :)

If you want to create an account on our page to check out our systems/structures feel free to do so -> **Creating accounts is free!**

Take all the time you need, be creative!

Don't be afraid to ask questions!

Use this email: frontend-hiring@bitpanda.com

****If you want to see what this response looks like**, check out our website and open the network tab -> look for the masterdata response there.
